PROGRAM COMPARISON – Health Care vs. Hospitals & Nurses

PROGRAM OBJECTIVES

HEALTH CARE is a general program, developed for broad appeal and wide application to the health care community. It is concise, easy to teach and learn, and it has been our most popular program. It is a “first step program”, applicable to providers, clinics, hospital personnel and other medical professionals.

HOSPITALS & NURSES is much more in-depth, covering all the topics in *Health Care* plus a great deal of clinical content that is very important in hospital situations. Additionally, there is a wealth of material for hospital staff in administrative and support positions.

While the hospital nurse is the primary target audience for this program, lab techs, physical therapists, admissions staff, and other key personnel will find the program material appropriate and helpful.

BOTH PROGRAMS are designed to improve communication with Spanish-speaking patients and their families, reduce the need for medical interpreters, and improve the quality of patient care.
